

## CL74AUP1G240 Low-Power Single Inverter With 3-State Output

### General Description

This single buffer/driver is designed for 0.8-V to 3.6-V VCC operation.

The CL74AUP1G240 device is a single line driver with a 3-state output. The output is disabled when the output-enable ( $\overline{OE}$ ) input is high.

To assure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to Vcc through a pullup resistor ; the minimum value of the resistor is determined by the current-sinking capability of the driver.

This device is fully specified for partial-power-down application using I<sub>off</sub>. The I<sub>off</sub> circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

The CL74AUP1G240 device is available in a variety of packages, including SOT23-5, SC70.

### Ordering Information

Part Number	Marking	Package
CL74AUP1G240_235	POPXW	SOT-23-5
CL74AUP1G240_70	PPXW	SC70

### Features

- Inputs Accept Voltages 0.8V to 3.6 V
- Max Tpd of 4.5 ns at 3.3 V
- Low Static-Consumption, 0.9- $\mu$ A Max I<sub>cc</sub>
- Low Noise Overshoot and Undershoot < 10% of V<sub>cc</sub>
- Input-Disable Feature Allows Floating Input Conditions

- I<sub>off</sub> Supports Live Insertion, Partial-Power-Down Mode, and Back-Drive Protection
- Input Hysteresis Allows Slow Input Transition and Better Switching Noise Immunity at Input (V<sub>hys</sub> = 250mV Typical 3.3V)
- 3.6V I/O Tolerant to Support Mixed-Mode Signal Operation
- Suitable for Point-to-Point Applications
- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II
- ESD Protection Exceeds JESD 22
  - 2000-V Human-Body Model (A114-A)
  - 1000-V Charged-Device Model (C101)

### Applications

- Grid Infrastructure
- Telecon Infrastructure
- Medical, Healthcare, and Fitness
- Factory Automation and Control
- Printers and Other Peripherals

### Pin Configuration

### Simplified Schematic

Pin Name	Pin No.	Pin Function
$\overline{OE}$	1	Input
A	2	Input
GND	3	Ground
Y	4	Output
VCC	5	Power pin

**Absolute Maximum Ratings (Note1)**

- $V_{CC}$  ----- -0.5V to +4.6V
- $V_I$ ----- -0.5V to +4.6V
- $V_O$ (Voltage range applied to any output in the high-impedance or power-off state)----- -0.3V to +4.6V
- $V_O$ (Voltage range applied to any output in the high or slow state)----- -0.3V to  $V_{CC}+0.3V$
- Input clamp current ----- -50mA
- Output clamp current ----- -50mA
- Continuous output current -----  $\pm 20mA$
- Storage Temperature -----  $-65^{\circ}C$  to  $150^{\circ}C$

**Recommended Operating Conditions**

Parameter	Symbol	Test Conditions	Min	Typ	Max	Units
Supply voltage	$V_{CC}$	Operating	0.8		3.6	V
Input voltage	$V_I$		0		3.6	V
Output voltage	$V_O$		0		VCC	V
High- level input voltage	$V_{IH}$	$V_{CC} = 0.8V$	$V_{CC}$			V
		$V_{CC} = 1.1V$ to $1.95V$	$0.65 \times V_{CC}$			
		$V_{CC} = 2.3V$ to $2.7V$	1.6			
		$V_{CC} = 3V$ to $3.6V$	2			
Low- level input voltage	$V_{IL}$	$V_{CC} = 0.8V$			0	V
		$V_{CC} = 1.1V$ to $1.95V$			$0.35 \times V_{CC}$	
		$V_{CC} = 2.3V$ to $2.7V$			0.7	
		$V_{CC} = 3V$ to $3.6V$			0.9	

High- level output current	$I_{OH}$	$V_{CC} = 0.8V$			-20	uA
		$V_{CC} = 1.1V$			-1.1	mA
		$V_{CC} = 1.4V$			-1.7	
		$V_{CC} = 1.65V$			-1.9	
		$V_{CC} = 2.3V$			-3.1	
		$V_{CC} = 3V$			-4	
Low- level output current	$I_{OL}$	$V_{CC} = 0.8V$			20	uA
		$V_{CC} = 1.1V$			1.1	mA
		$V_{CC} = 1.4V$			1.7	
		$V_{CC} = 1.65V$			1.9	
		$V_{CC} = 2.3V$			3.1	
		$V_{CC} = 3V$			4	
Input transition rise or fall rate	$\Delta T/\Delta V$	$V_{CC} = 0.8V$ to $3.6V$			200	ns/V
Operating temperature	$T_A$		-40		85	°C

## Electrical Characteristics

Parameter	Symbol	Test Conditions	Min	Typ	Max	Units
High- level output voltage	$V_{OH}$	$V_{CC} = 0.8\sim 3.6V, I_{OH} = -20\mu A$	$V_{CC}-0.1$			V
		$V_{CC} = 1.1V, I_{OH} = -1.1mA$	$0.75 \times V_{CC}$			
		$V_{CC} = 1.4V, I_{OH} = -1.7mA$	1.11			
		$V_{CC} = 1.65V, I_{OH} = -1.9mA$	1.32			
		$V_{CC} = 2.3V, I_{OH} = -2.3mA$	2.05			
		$V_{CC} = 2.3V, I_{OH} = -3.1mA$	1.9			
		$V_{CC} = 3V, I_{OH} = -2.7mA$	2.72			
		$V_{CC} = 3V, I_{OH} = -4mA$	2.6			
Low- level output voltage	$V_{OL}$	$V_{CC} = 0.8\sim 3.6V, I_{OL} = 20\mu A$			0.1	V
		$V_{CC} = 1.1V, I_{OL} = 1.1mA$			$0.3 \times V_{CC}$	
		$V_{CC} = 1.4V, I_{OL} = 1.7mA$			0.31	
		$V_{CC} = 1.65V, I_{OL} = 1.9mA$			0.31	
		$V_{CC} = 2.3V, I_{OL} = 2.3mA$			0.31	
		$V_{CC} = 2.3V, I_{OL} = 3.1mA$			0.44	
		$V_{CC} = 3V, I_{OL} = 2.7mA$			0.31	
		$V_{CC} = 3V, I_{OL} = 4mA$			0.44	
Input leakage current	$I_I$	$V_{IN} = 3.6V$ or GND, $V_{CC} = 0\sim 3.6V$			0.1	uA
Power off leakage current	$I_{OFF}$	$V_I$ or $V_O = 0V$ to $3.6V, V_{CC} = 0V$			0.2	uA
Supply current	$I_{CC}$	$V_I = GND$ or ( $V_{CC}$ to $3.6V$ ), $I_{OUT} = 0$ , $V_{CC} = 0.8\sim 3.6V$			0.5	uA
Additional supply current per input pin	$\Delta I_{CC}$	$V_I = V_{CC} - 0.6V, I_{OUT} = 0$			40	uA

Inverting and Non Inverting Outputs**

**Voltage Waveform Enable and Disable Times  
Low- and High-Level Enabling**

- Notes:
- A. C<sub>L</sub> includes probe and jig capacitance
  - B. All pulses and supplied at pulse repetition rate  $\leq 10\text{MHz}$
  - C. The Inputs are measured separately one transition per measurement
  - D. t<sub>PZL</sub> and t<sub>PHZ</sub> are the same as t<sub>dis</sub>
  - E. t<sub>PZL</sub> and t<sub>PZH</sub> are the same as t<sub>en</sub>
  - F. t<sub>PLH</sub> and t<sub>PHL</sub> are the same as t<sub>pD</sub>

## IC Operation Information

### Basic Operation

This device contains one inverter gate device with active low output enable control and performs the Boolean function  $Y = \overline{A}$ . This device is fully specified for partial-power-down applications using  $I_{off}$ . The  $I_{off}$  circuitry disables the outputs when the device is powered down. This inhibits current backflow into the device, which prevents damage to the device.

To assure the high-impedance state during power up or power down,  $\overline{OE}$  must be tied to  $V_{CC}$  through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

### Function Block Diagram

### Feature Description

- Wide operating voltage range.
  - Operates from 1.65 V to 5.5 V.
- Allows down voltage translation.
- Inputs accept voltages to 5.5 V.
- $I_{off}$  feature allows voltages on the inputs and outputs when  $V_{CC}$  is 0 V..

### Device Functional Table

INPUTS		OUTPUT Y
$\overline{OE}$	A	
L	H	L
L	L	H
H	X <sup>(1)</sup>	Z

## IC Application Information

The AUP family is the solution to the industry's low-power needs in battery-powered portable applications. This family assures a very low static and dynamic power consumption across the entire  $V_{CC}$  range of 0.8 V to 3.6 V, resulting in an increased battery life. This product also maintains excellent signal integrity. It has a small amount of hysteresis built in allowing for slower or noisy input signals.

The lowered drive produces slower edges and prevents overshoot and undershoot on the outputs. The AUP family of single gate logic makes excellent translators for the new lower voltage microprocessors that typically are powered from 0.8 V to 1.2 V. They can drop the voltage of peripheral drivers and accessories that are still powered by 3.3 V to the lower voltage levels.

The CL74AUP1G240 is essentially an inverter that can be placed into a high-impedance state. In this application, the output is forced to  $V_{CC}$  when the CL74AUP1G240's output is disabled, and when the output is enabled, the device performs the function  $Y = \overline{A}$ .

### Typical Application

### Design Requirements

This device uses CMOS technology and has balanced output drive. Take care to avoid bus contention because it can drive currents that would exceed maximum limits. The high drive also creates fast edges into light loads so routing and load conditions should be considered to prevent ringing.

## Detailed Design Procedure

### 1. Recommended Input Conditions

- Rise time and fall time specs. See ( $\Delta t/\Delta V$ ) in the Recommended Operating Conditions table.
- Specified high and low levels. See ( $V_{IH}$  and  $V_{IL}$ ) in the Recommended Operating Conditions table.
- Inputs are overvoltage tolerant allowing them to go as high as ( $V_I$  max) in the Recommended Operating Conditions table at any valid  $V_{CC}$ .

### 2. Recommend Output Conditions

- Load currents should not exceed ( $I_O$  max) per output and should not exceed total current (continuous current through  $V_{CC}$  or GND) for the part. These limits are located in the Absolute Maximum Ratings table.
- Outputs should not be pulled above  $V_{CC}$ .

## Power Supply Recommendations

The power supply can be any voltage between the min and max supply voltage rating located in the Recommended Operating Conditions table.

The  $V_{CC}$  pin must have a good bypass capacitor to prevent power disturbance. TI recommends to use a 0.1- $\mu F$  capacitor for this device. It is ok to parallel multiple bypass caps to reject different frequencies of noise. 0.1- $\mu F$  and 1- $\mu F$  capacitors are commonly used in parallel. Install the bypass capacitor as close to the power pin as possible for best results.

## Layout Considerations

When using multiple bit logic devices inputs should not ever float. In many cases, functions or parts of functions of digital logic devices are unused; for example, when only two inputs of a triple-input AND gate are used or only 3 of the 4 buffer gates are used. Such input pins should not be left unconnected because the undefined voltages at the outside connections result in undefined operational states. Specified below are the rules that must be observed under all circumstances. All unused inputs of digital logic devices must be connected to a high or low bias to prevent them from floating. The logic level that should be applied to any particular unused input depends on the function of the device. Generally they will be tied to GND or  $V_{CC}$  whichever make more sense or is more convenient.
