

CL74AUP1G04 Low Power Single Inverter Gate

General Description

This single inverter gate is designed for 0.8-V to 3.6-V V_{CC} operation.

The CL74AUP1G04 device performs the Boolean function $Y = \overline{A}$.

The CMOS device has high output drive while maintaining low static power dissipation over a broad V_{CC} operating range.

The CL74AUP1G04 device is available in a variety of packages, including SOT23-5, SC70.

Ordering Information

Part Number	Marking	Package
CL74AUP1G04-235	P04XW	SOT-23-5
CL74AUP1G04-70	PCXW	SC70

Features

- Inputs Accept Voltages 0.8V to 3.6 V
- Max Tpd of 5.4 ns at 3.3 V
- Low Static-Consumption, 0.9- μ A Max I_{CC}
- Low Noise Overshoot and Undershoot <10% of V_{CC}
- Ioff Supports Live Insertion, Partial-Power-Down Mode, and Back-Drive Protection
- Input Hysteresis Allows Slow Input Transition and Better Switching Noise Immunity at Input ($V_{hys} = 250\text{mV}$ Typical 3.3V)
- 3.6V I/O Tolerant to Support Mixed-Mode Signal Operation
- Suitable for Point-to-Point Applications
- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II

- ESD Protection Exceeds JESD 22
 - 2000-V Human-Body Model (A114-A)
 - 1000-V Charged-Device Model (C101)

Applications

- ATCA Solutions
- Active Noise Cancellation (ANC)
- Barcode Scanner
- Blood Pressure Monitor
- CPAP Machine
- Cable Solutions
- DLP 3DMachine Vision, Hyperspectral Imaging, Optical Networking, and Spectroscopy
- E-Book
- Embedded PC
- Field Transmitter: Temperature or Pressure Sensor
- Fingerprint Biometrics
- HVAC: Heating, Ventilating, and Air Conditioning

IC Operation Information

Basic Operation

The CL74AUP1G04 device contains Inverter gate device and performs the Boolean function $Y = \overline{A}$. The AUP family of devices has quiescent power consumption less than 1 μ A. This device is fully specified for partial-power-down applications using Ioff. The Ioff circuitry disables the outputs, preventing damaging current backflow through the device when it is powered. The Ioff feature also allows for live insertion.

Function Block Diagram

Feature Description

- Wide operating Vcc range of 0.8V to 3.6V.
- 3.6-V I/O tolerant to support down translation.
- Input hysteresis allows slow input transition and better switching noise immunity at the input.
- Ioff feature allows voltages on the inputs and outputs when Vcc is 0 V.
- Low noise due to slower edge rates.

IC Application Information

The AUP family is the solution to the industry's low-power needs in battery-powered portable applications. This family ensures a very low static and dynamic power consumption across the entire VCC range of 0.8 V to 3.6 V, resulting in an increased battery life. This product also maintains excellent signal integrity. It has a small amount of hysteresis built in allowing for slower or noisy input signals. The lowered drive produces slower edges and prevents overshoot and undershoot on the outputs.

Typical Application

Design Requirements

This device uses CMOS technology and has balanced output drive. Take care to avoid bus contention because it can drive currents that would exceed maximum limits

Detailed Design Procedure

1. Recommended Input conditions:
 - Rise time and fall time specs. See ($\Delta t/\Delta V$)
 - Specified high and low levels. See (VIH and VIL)
 - Inputs are overvoltage tolerant allowing them to go as high as 3.6 V at any valid VCC
2. Recommended output conditions:
 - Load currents should not exceed 20 mA on the output and 50 mA total for the part
 - Outputs should not be pulled above VCC

Power Supply Recommendations

The power supply can be any voltage between the Min and Max supply voltage rating located in the Recommended Operating Conditions table. Each VCC pin should have a good bypass capacitor to prevent power disturbance. For devices with a single supply, 0.1 μF is recommended; if there are multiple VCC pins, then 0.01 μF or 0.022 μF is recommended for each power pin. It is acceptable to parallel multiple bypass caps to reject different frequencies of noise. A 0.1 μF and a 1 μF are commonly used in parallel. The bypass capacitor should be installed as close to the power pin as possible for best results.

Layout Considerations

When using multiple-bit logic devices, inputs should never float. In many cases, functions or parts of functions of digital logic devices are unused, for example, when only two inputs of a triple-input AND gate are used or only 3 of the 4 buffer gates are used. Such input pins should not be left unconnected because the undefined voltages at the outside connections result in undefined operational states. Below figure specifies the rules that must be observed under all circumstances. All unused inputs of digital logic devices must be connected to a high or low bias to prevent them from floating. The logic level that should be applied to any particular unused input depends on the function of the device. Generally they will be tied to GND or VCC, whichever makes more sense or is more convenient. It is generally acceptable to float outputs, unless the part is a transceiver. If the transceiver has an output enable pin, it will disable the output section of the part when asserted. This will not disable the input section of the I/Os, so they cannot float when disabled.
